

The taxonomy and biogeography of macrofaunal **amphipod crustaceans**, with a focus on the abyssal Pacific fauna relevant to the CCFZ:

Part II: What can DNA tell us?

Charlotte Havermans

Introduction: *Why and how*

Deep-sea macrofaunal taxonomy: challenges

An introduction to DNA barcoding

Molecular deep-sea studies

Molecular work on deep-sea amphipods (*own results & literature*)

Integrative approach (genes & morphology; reverse taxonomy)

Case study 1: DNA barcoding *Orchomene sensu lato*

Case study 2: Phylogeography *Eurythenes gryllus*

« Blind » taxonomic approach (MOTUs)

DNA barcoding for amphipod diversity studies

Outlook: goals beyond species identification

Deep-sea macrofaunal taxonomy

- ✓ Incomplete species descriptions
- ✓ Many species (genera, families) new to science
- ✓ Cryptic species?
- ✓ How to evaluate intraspecific variability, sexual dimorphism?

Hirondellea antarctica - (Schellenberg, 1926)
ANT XVII/3

Deep-sea macrofaunal taxonomy

- ✓ Incomplete species descriptions
- ✓ Many species (genera, families) new to science
- ✓ Cryptic species?
- ✓ How to evaluate intraspecific variability, sexual dimorphism?

Hirondellea antarctica - (Schellenberg, 1926)
ANT XVII/3

A variety of deep-sea molecular studies

- ✓ past studies using allozymes: **amphipods** (Bucklin et al. 1987, France et al. 1992, France 1994), polychaetes (Jollivet et al. 1995), vent shrimps (Creasey et al. 1996), brachiopods (Valentine & Ayala 1975), spider crabs (Creasey et al. 1997)
- ✓ mt DNA sequence analysis:
 - 16S rDNA (**amphipods**: France & Kocher 1996, Escobar-Briones et al. 2010; mollusks: Etter et al. 1999, 2005, Chase et al. 1998, Quattro et al. 2001, Zardus et al. 2006)
 - D-loop, cyt *b* regions (fish: Aboim et al 2005)
 - COI & 16S rDNA (corals: Smith et al. 2004)
- ✓ combined (e.g. nuclear & mtDNA):
 - COI + 28S rDNA + calmodulin intron (bivalves: Glazier & Etter 2014)
 - (COI), 16S & 18S rDNA (isopods: Raupach et al. 2007, Brix et al. 2014)
 - COI, 16S, 18S & 28S rDNA, Histone 3 (**amphipods**: Corrigan et al. 2014)
 - COI and allozyme data (vent mussels: Won et al. 2003, Miyazaki et al. 2004)
 - COI and ribosomal ITS-1 (vent clams: Goffredi et al. 2003)
 - ITS, COI, mitochondrial control region MtC (corals: Miller et al. 2011)
- ✓ fast-evolving markers:
 - microsatellites + ITS (corals: Le Goff-Vitry et al. 2004)
 - Amplified fragment length polymorphisms (AFLPs) (vent tubeworms: Shank & Halanych 2007)

DNA barcoding

✓ Recent initiative (2003): the use of a standardized short DNA sequence for species identification

→ part of the genome evolving quickly enough for assessing recent speciation events :

cytochrome c oxidase I gene (COI)

Waugh 2007

DNA barcoding

DNA barcoding

1

2

DNA barcoding

specimen → barcode → match in barcode library → species

specimen

1

2

3

barcode

DNA barcoding

intraspecific variation < interspecific divergences

→ differentiating species

Neighbour-Joining tree based on genetic distances between specimens

✓ Some examples of deep-sea studies using COI:

- Octocorals: divergences too low (France & Hoover 2002)
- Vent-endemic gastropods (Kojima et al. 2000), annelids (Black et al. 1997, Hurtado et al. 2004), clams (Peck et al. 1997), mussels (Maas et al. 1999), shrimps (Shank et al. 1999)
- **Amphipods** (Knox et al. 2012)

Integrative taxonomic studies on lysianassoids

- ✓ thrive in cold waters: shallow waters of high latitudes & deep sea
- ✓ abundant & diverse
- ✓ mostly scavengers; benthic, benthio-pelagic, pelagic species

Antarctic shallow & deep

Case study 1: *Orchomene sensu lato*

DNA barcoding
COI, (28S rDNA)

Reverse taxonomy (*sensu* Kanzaki et al. 2012)
descriptions

World's Deep Seas

Case study 2: *Eurythenes gryllus*

Phylogeography
COI, 16S, 28S rDNA

Reverse taxonomy: descriptions

General methodology

✓ sampling of lysianassoids

Agassiz Trawl

Epibenthic sledge

bait

Rauschert dredge

Lander with amphipod traps

General methodology

✓ sampling of lysianassoids

Baited trap samples:

High number of specimens/species

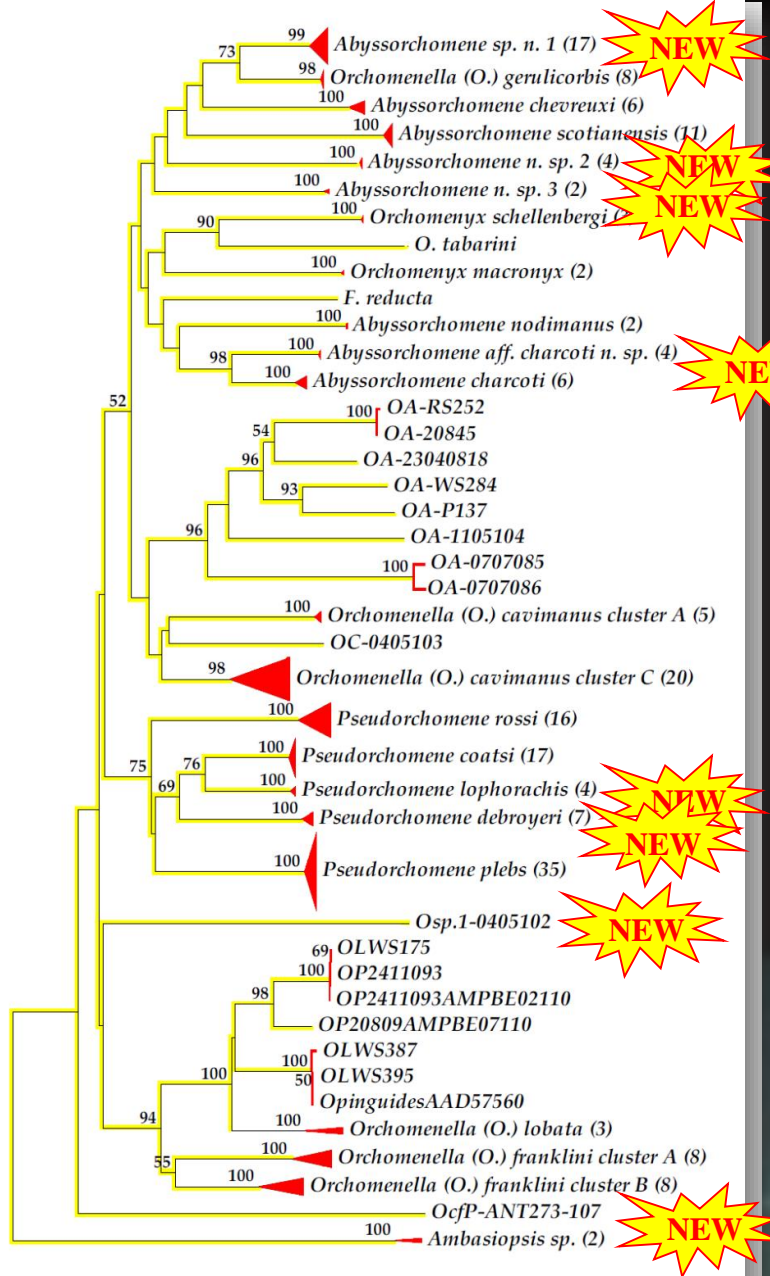

→ Phylogeographic & population genetic studies

General methodology

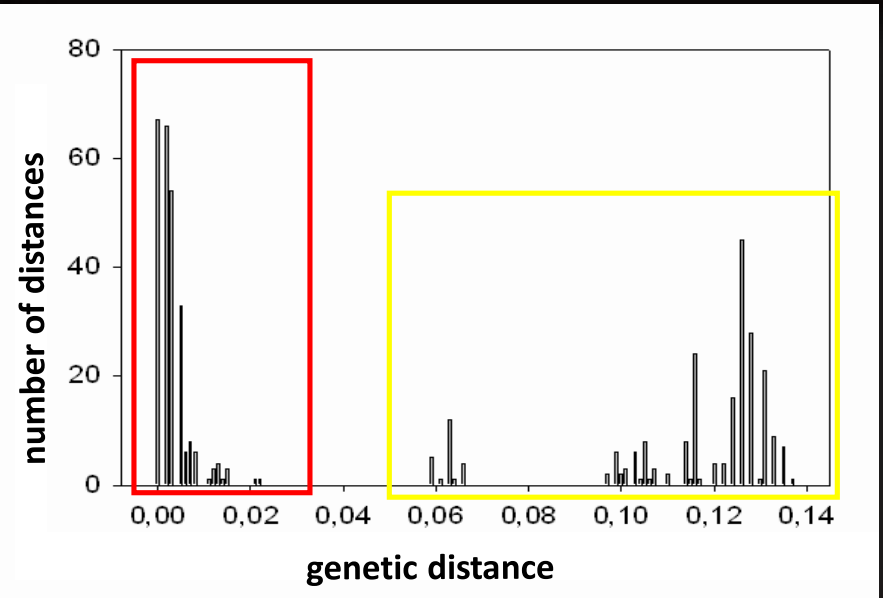

- ✓ preservation of samples for genetics: 96% ethanol or absolute, pre-cooled
- ✓ storage at -20°C
- ✓ DNA extractions using standard kits (Qiagen, Macherey-Nagel)
- ✓ PCR:
 - COI using universal primers (Folmer et al. 1994)
 - 16S rDNA using universal primers (Palumbi et al. 1991)
 - 28S rDNA using amphipod specific primers 28F, 28R (Hou et al. 2007)
- ✓ Sanger sequencing: ABI 3130xl capillary DNA sequencer

0.02

DNA barcoding *Orchomene sensu lato*

- ✓ +/- 250 specimens
- ✓ 25 different species

- ✓ 8 new species, 2 described
- ✓ topologies confirmed by 28S rDNA

Genetically homogeneous species

Abyssorhomenella abyssorum (Stebbing, 1888)

genetic divergence:
 $\mu = 0.7\% (0.0 - 1.5\%)$

bathymetric range:
 310 – 4586 m

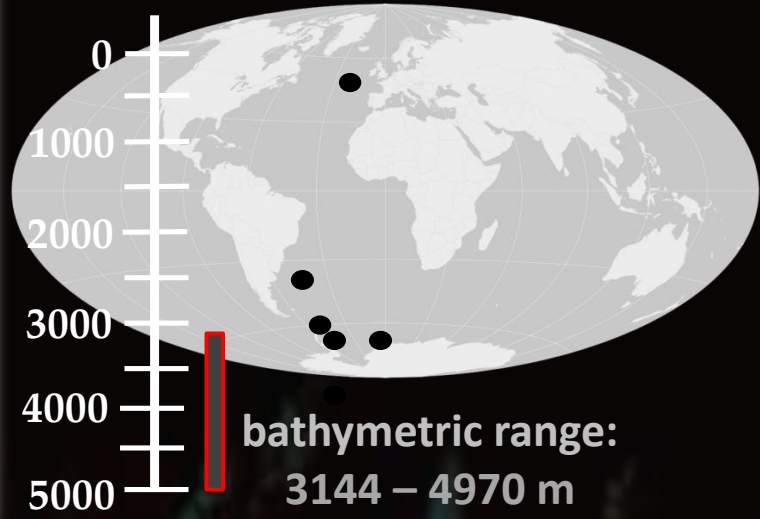

widespread & eurybathic

Genetically homogeneous species (2)

Abyssorhomenella chevreuxi (Stebbing, 1906)

genetic divergence:
 $\mu = 0.5\% (0.2 - 1.2\%)$

widespread

Species complexes

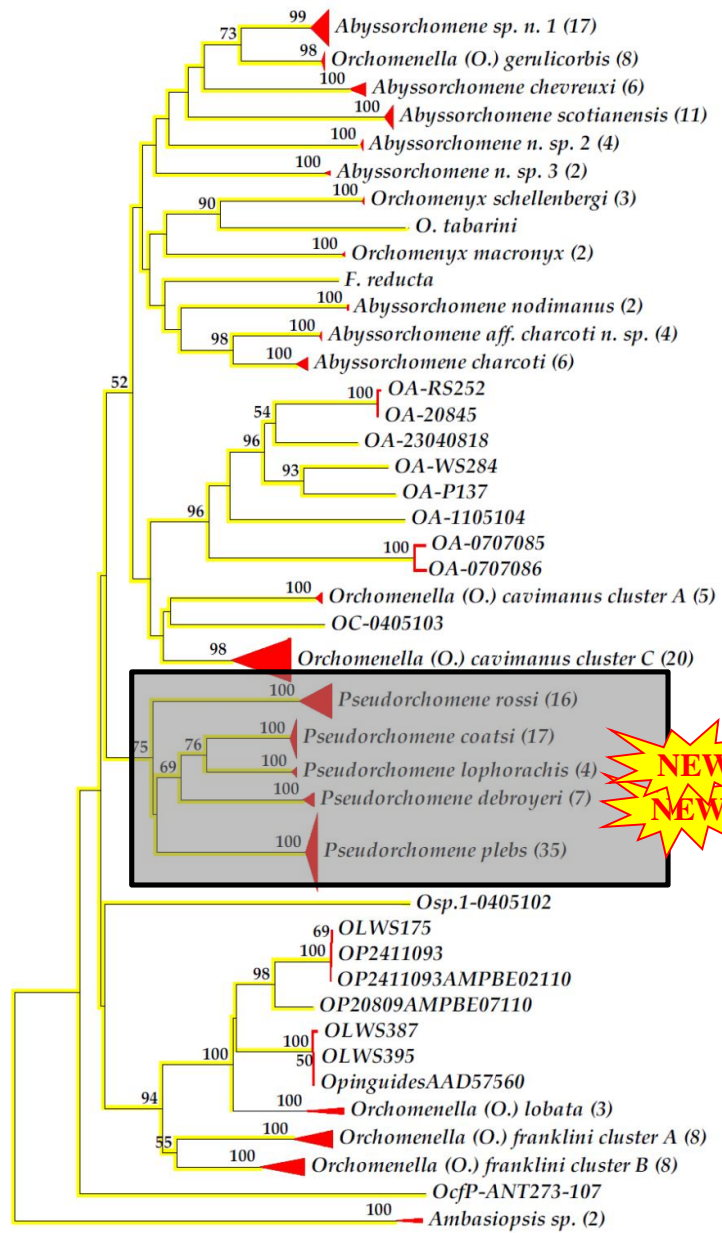

genetic divergences in the range of interspecific distances ($\mu = 10 - 15 \%$)

species complexes:

- Orchomenella* (*Orchomenopsis*) *acanthurus*
- Orchomenella* (*Orchomenopsis*) *cavimanus*
- Orchomenella* (O.) *pinguides*
- Orchomenella* (O.) *franklini*

restricted & widespread clades

Reverse taxonomy approach for orchomenids

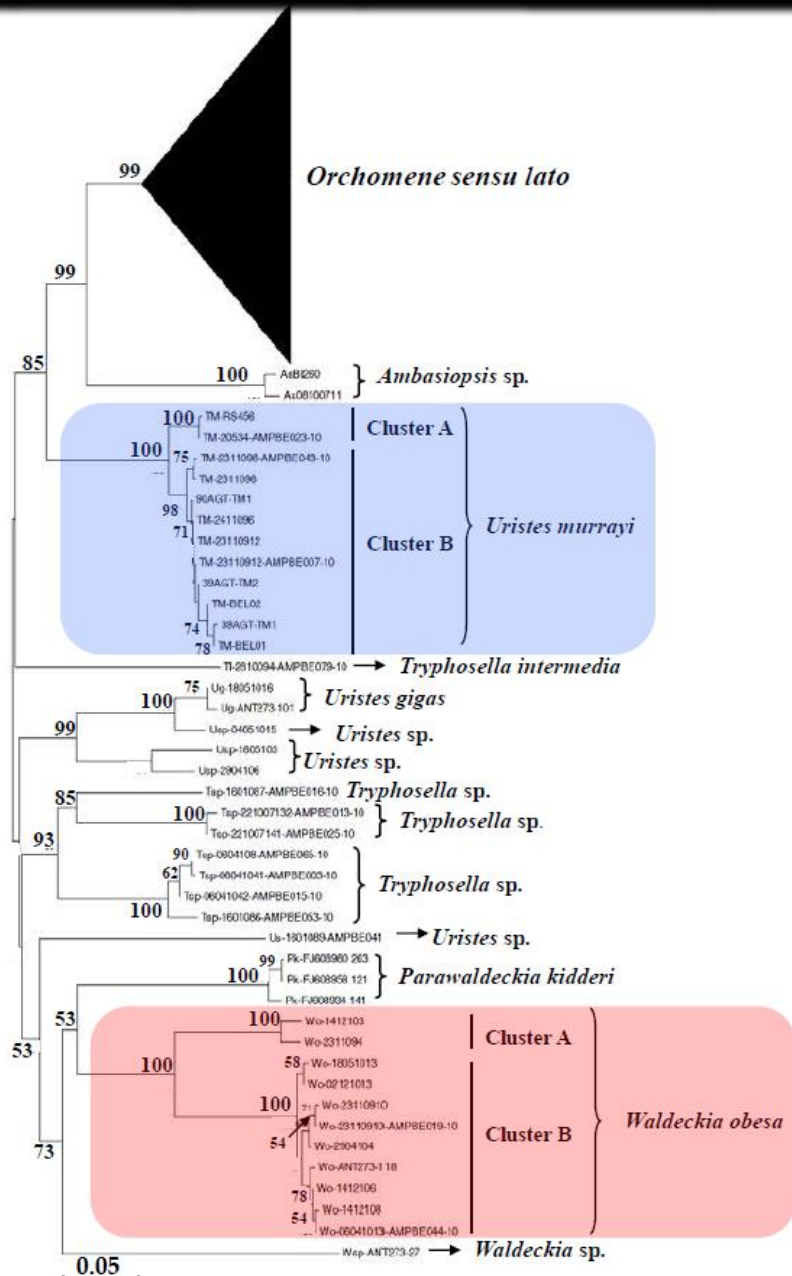

- ✓ Revision of *Pseudorchomene* systematics:
Abyssorhomene → *Pseudorchomene*
- ✓ Description of two new species:

Pseudorchomene debroyeri

Pseudorchomene lophorachis

Neighbour-Joining Tree of COI sequences of lysianassoid species (K2P model, bootstrap nreps 2000). Coloured rectangles indicate species complexes.

Extending the DNA barcoding approach to other lysianassoids

Presence of barcoding gap:
Bimodal distribution of **intra- (0 – 6.5 %)** & **interspecific (15.2 – 35.7 %)** divergences

species complexes:

Uristes murrayi
Waldeckia obesa

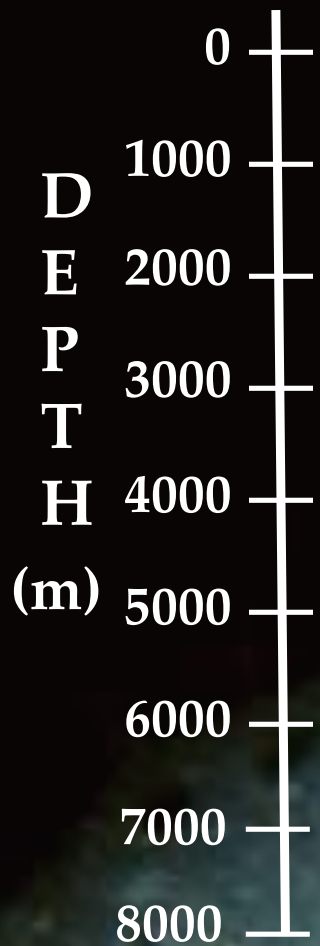

restricted & widespread clades

COI also efficient in delimiting species in other amphipod genera:

- Antarctic *Epimeria* (Lörz et al. 2009)
- Deep-sea *Rachothropis* (Lörz et al. 2012)
- Deep-sea Phoxocephalidae (Knox et al. 2012)

Phylogeography of *Eurythenes gryllus*

- ✓ giant, benthopelagic scavenger
- ✓ most widespread amphipod species:

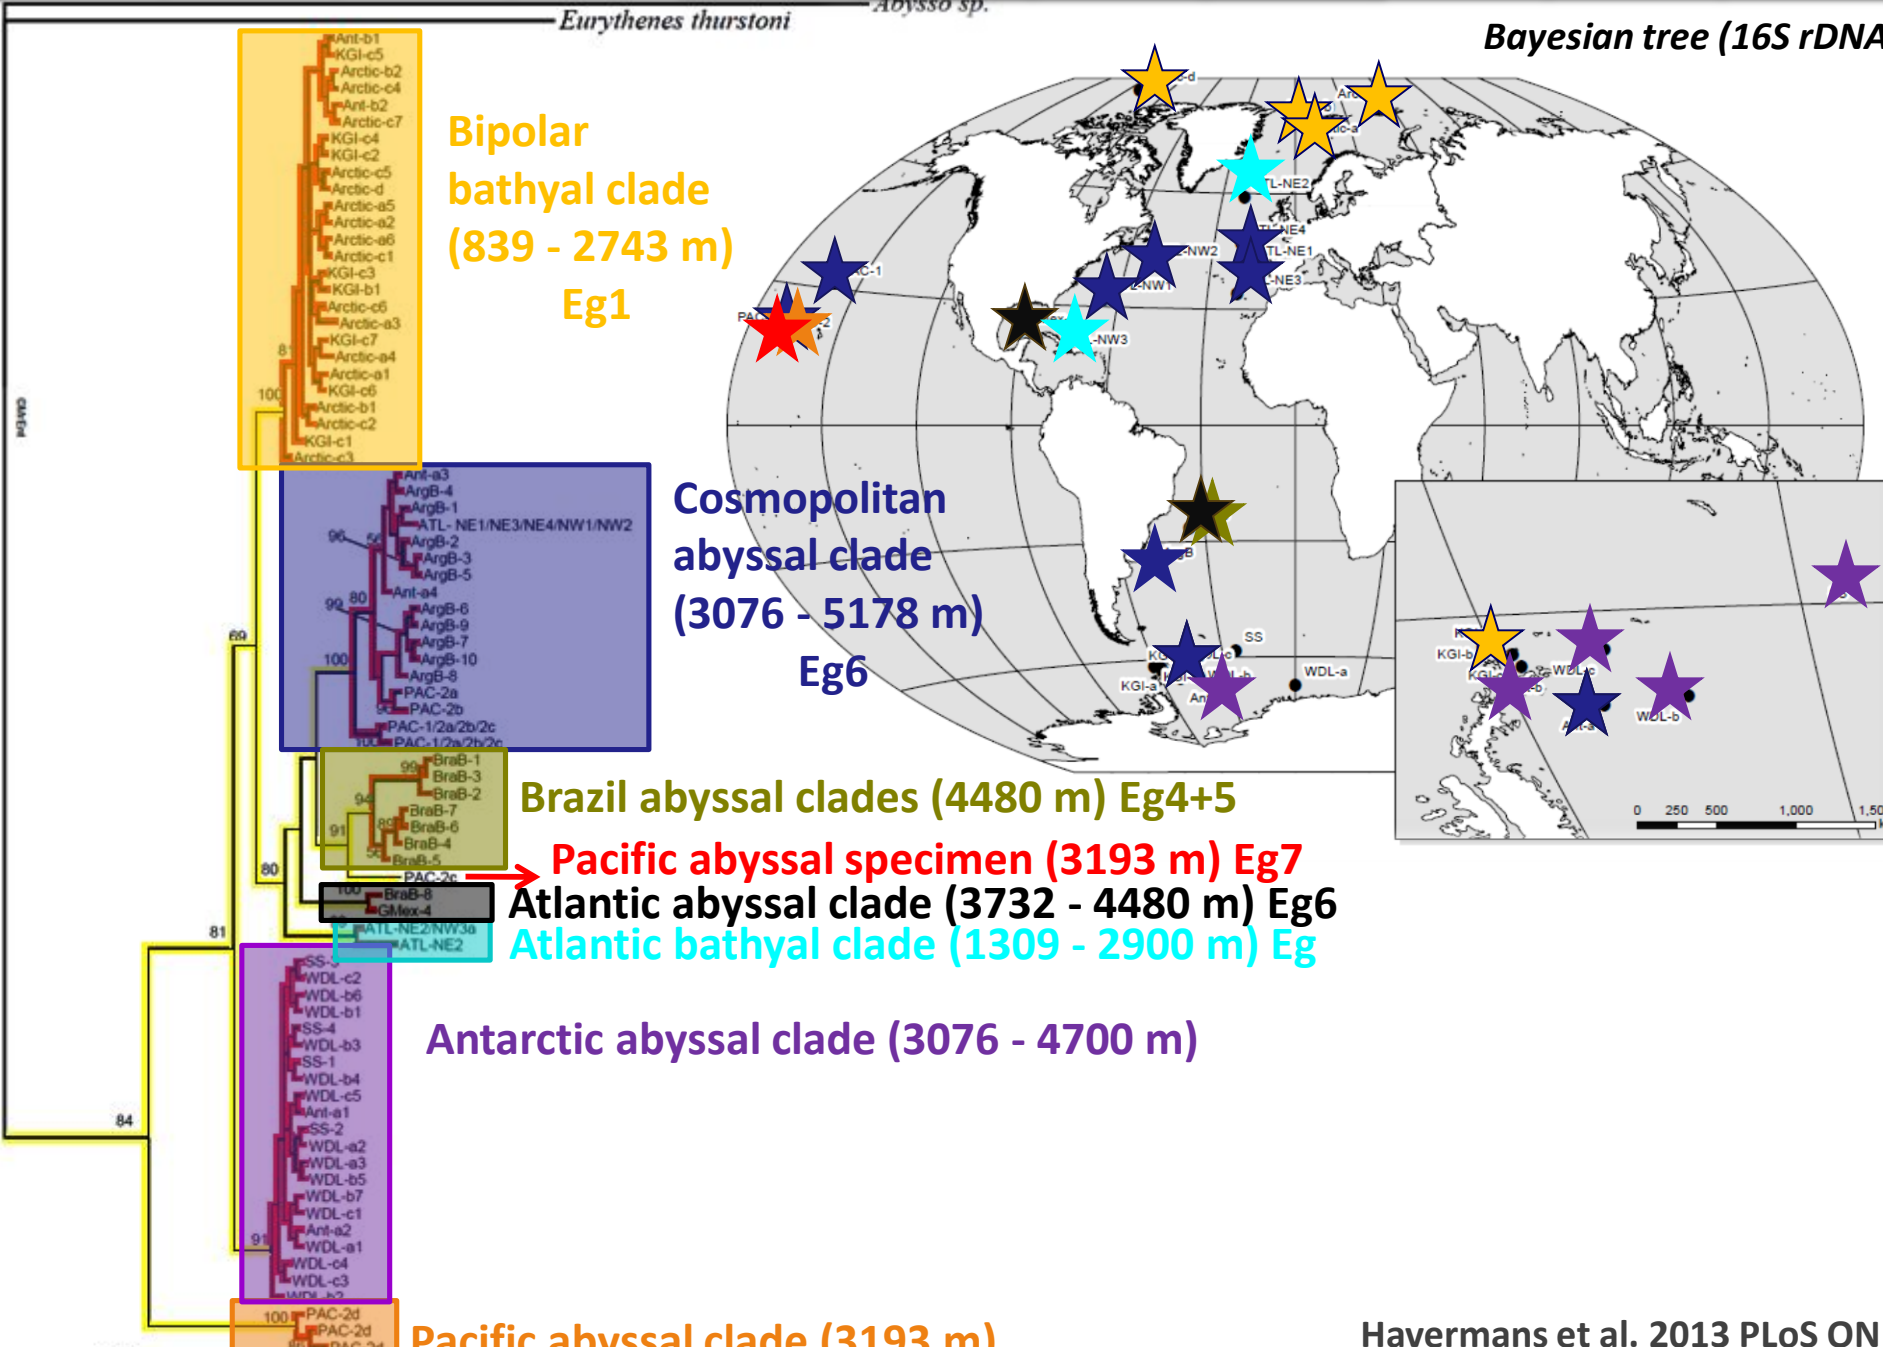

Introduction - Results - Outlook

Eurythenes thurstoni - *Abyssos sp.*

Bayesian tree (16S rDNA)

Bipolar bathyal clade (839 - 2743 m) Eg1

Cosmopolitan abyssal clade (3076 - 5178 m) Eg6

Brazil abyssal clades (4480 m) Eg4+5

Pacific abyssal specimen (3193 m) Eg7

Atlantic abyssal clade (3732 - 4480 m) Eg6

Atlantic bathyal clade (1309 - 2900 m) Eg

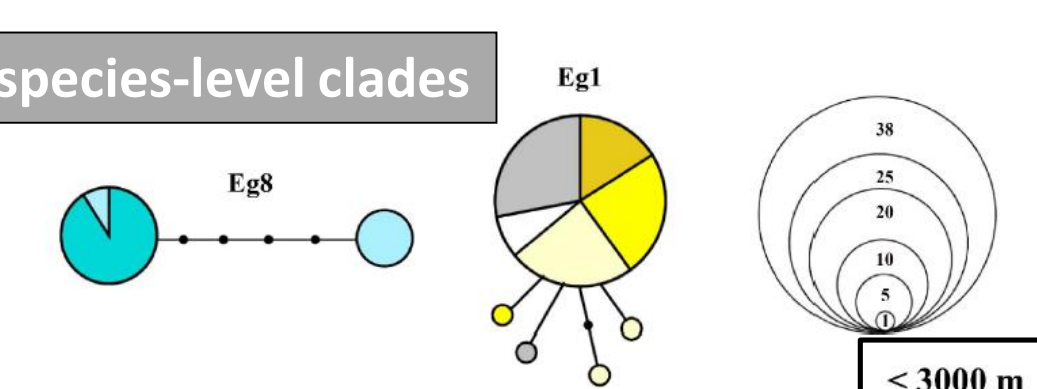

Antarctic abyssal clade (3076 - 4700 m)

Pacific abyssal clade (3193 m)

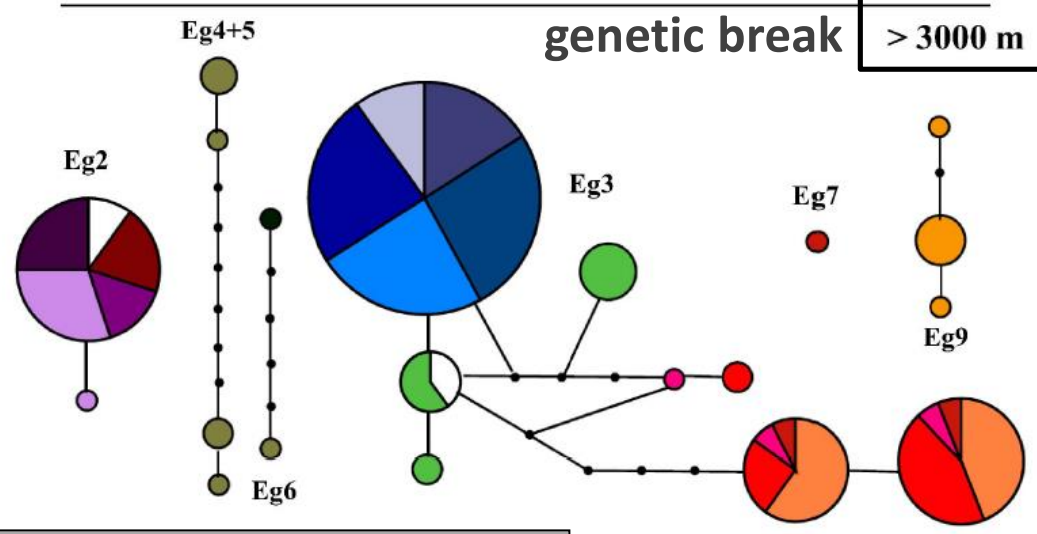

16S rRNA gene haplotype

2 bathyal species-level clades

genetic break

< 3000 m
 > 3000 m

6 abyssal species-level clades

- Iberia Abyssal Plain (ATL-NE1)
- Madeira Abyssal Plain (ATL-NE3)
- West European Basin (ATL-NE4)
- Nares Abyssal Plain (ATL-NW1)
- Sohm Abyssal Plain (ATL-NW2)
- Iceland Basin (ATL-NE2)
- Bahamas (ATL-NW3a)
- King George Island (KGI-a/b/c)
- Antarctic Peninsula (Ant-a/b)
- South Sandwich Islands (SS)
- Weddell Sea (WDL-a)
- Weddell Sea (WDL-b)
- Weddell Sea (WDL-c)
- Central North Pacific (PAC-1)
- Horizon Guyot base (PAC-2a)
- Horizon Guyot base (PAC-2b)
- Horizon Guyot slope (PAC-2c)
- Horizon Guyot slope (PAC-2d)
- Eastern Fram Strait (Arctic-a/b)
- Svalbard (Arctic-c)
- Canada Basin (Arctic-d)
- Argentine Basin (ArgB)
- Brazil Basin (BraB)
- Gulf of Mexico (GMex-4)

- Species richness compared: \leftrightarrow depth differentiation hypothesis (Etter et al. 2005)

Bathyal

2 species-level clades,
one bipolar and one
widespread

Abyssal

6 species-level clades,
several widespread
some restricted to a
single ocean basin

- 3 species-level clades in Pacific: found on 1 seamount at \neq depths
- Genetic break at 3000 m: ubiquitous barrier? Also for bivalve species. (Zardus et al. 2006, Glazier & Etter 2014)

→ Bathymetry plays an obvious role in speciation

Table 2. Range and mean of pairwise K2P intraclade and interclade distances for COI, 28S rDNA and 16S rDNA for each clade identified within *Eurythenes gryllus* (sequence data from this study, France and Kocher [12], Escobar-Briones *et al.* [36]).

| | Intraclade (K2P) divergences | | Interclade (K2P) divergences | |

barcoding gap

Reverse taxonomy approach for *E. gryllus*

- ✓ « True » *E. gryllus* = bipolar clade Eg1
- ✓ Unique combination of morphological characters for specimens from clades Eg1, 2, 3, 4+5, 6
- ✓ Species Eg1, 2, 3, 4+5 and 6 currently being (re)described

“Blind” taxonomic studies on amphipods

- ✓ MOTUs: Molecular Operational Taxonomic Units
- ✓ Comparative diversity studies on abundant but understudied taxa
- ✓ Thresholds for species assignment (see other amphipod barcoding studies e.g. Witt et al. 2006, Costa et al. 2009, Radulovici et al. 2009, Bradford et al. 2010, Havermans et al. 2011)
- ✓ Knox et al. (2012) – abundance & diversity of deep-sea phoxocephalids

| Station | Supranet abundance (ind./1000m ²) | Combined nets raw abundance | Number of COI sequences | Number of MOTUs | | |
|---------|--|--------------------------------|----------------------------|-----------------|------------|-----|
| | | | | Total | Singletons | % |
| CR024 | 389 | 207 | 32 | 8 | 1 | 13 |
| CR041 | 103 | 216 | 27 | 8 | 0 | 0 |
| CR049 | 190 | 126 | 10 | 4 | 1 | 25 |
| CR065 | 130 | 88 | 12 | 6 | 2 | 33 |
| CR083 | 170 | 375 | 29 | 10 | 1 | 10 |

| CP139 | 59 | 61 | 10 | 5 | 3 | 60 |

Singleton molecular operational taxonomic units (MOTUs) are those which occur at a single station only.
COI, cytochrome oxidase *c* subunit I.

Knox et al. 2012 PLoS ONE

ANT XXI/2 St. 233 840 m 7 mm

M. Rauschert

Conclusions

- ✓ DNA barcoding efficient:
 - Bimodal distribution of divergences & presence barcoding gap
 - Morphospecies retrieved in monophyletic clusters
- Testing hypotheses on faunal distributions:
 - endemism vs. eurybathy, cosmopolitism
- Large-scale comparative biodiversity studies

- ✓ Lysianassoid species richness clearly underestimated !!

Beyond species identifications...

✓ genetic connectivity, species' distributions:

- F-statistics, AMOVA, network analyses, mismatch distribution analysis
→ population expansions, bottlenecks, founder events
→ vulnerability of populations: possibility of recolonization?

✓ phylogenetic analyses: evolution of deep-sea taxa:

- **Lysianassoids**: diversification scavengers set at Eocene/Oligocene cooling (Corrigan et al. 2013)

✓ testing hypotheses in deep-sea biogeography & ecology:

- Depth-differentiation analysis (Etter et al. 2005): bathyal vs. abyssal
- Source-sink hypothesis (Rex et al. 2005)
- Genetic break around 3000 m ? (bivalves Zardus et al. 2006, Glazier & Etter 2014)

~~« Abyssal endemism appears to be low »
Etter et al. (2005), Rex et al. (2005)~~

~~« Abyssal populations exhibit only modest genetic structure »
Etter et al. (2011)~~

Thank you!

Amphipod photos from Cédric d'Udekem d'Acoz, Bruno Danis, Martin Rauschert.
