

A photograph of a hydrothermal vent ecosystem, likely a black smoker. The central feature is a dark, conical structure emitting a plume of white smoke. The surrounding area is covered in a dense, colorful microbial mat with shades of green, yellow, and red. The background is dark and rocky.

# Characteristics of vent ecosystems relevant to the design of reference zones

**Anna Metaxas**

Department of Oceanography, Dalhousie University

# Vent ecosystems at a glance

- Ecosystems fuelled by microbes which use the fluid as energy
- Most species are only found at hydrothermal vents
- Their habitat is patchy and not very extensive (10s -100s m<sup>2</sup>)

# Species with complex life cycles

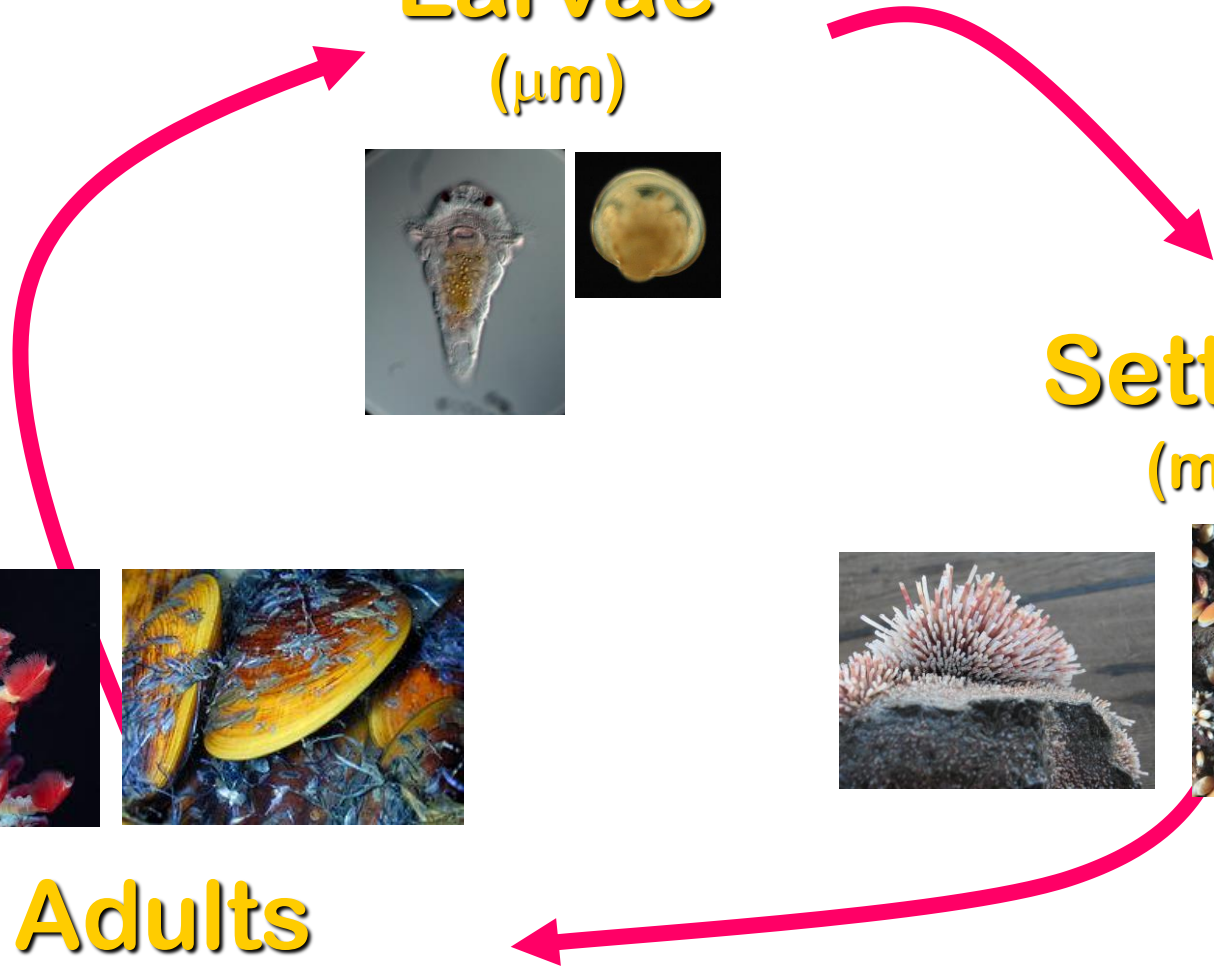

**Larvae**  
( $\mu\text{m}$ )

**Settlers**  
(mm)

**Adults**  
(cm)

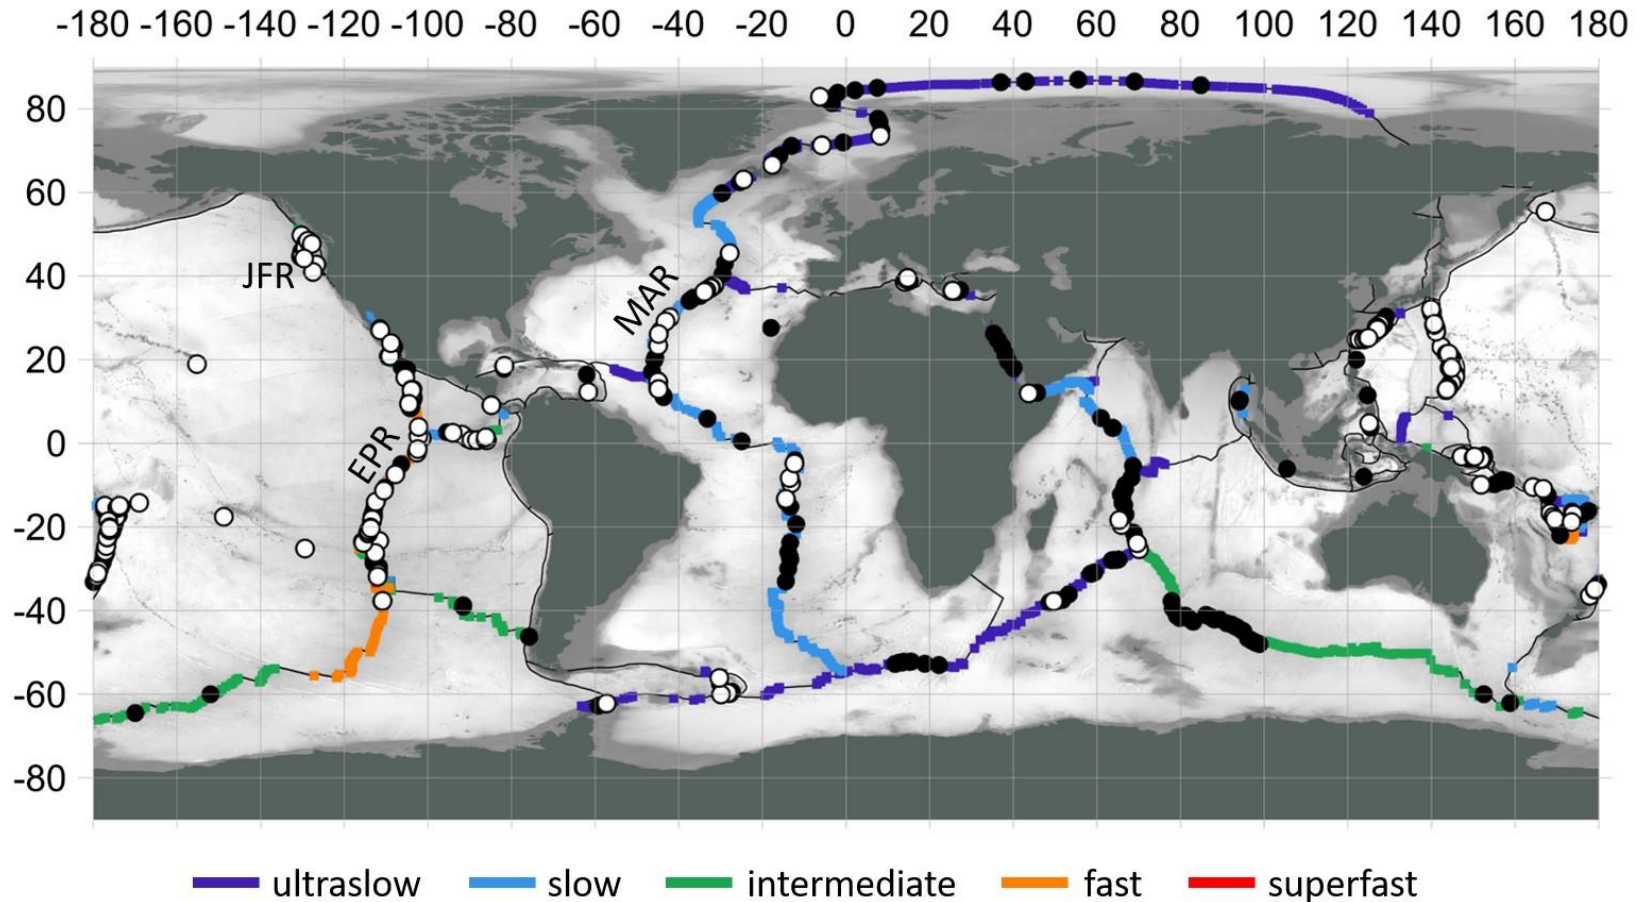

# How much do the ecosystems vary *naturally* over time?

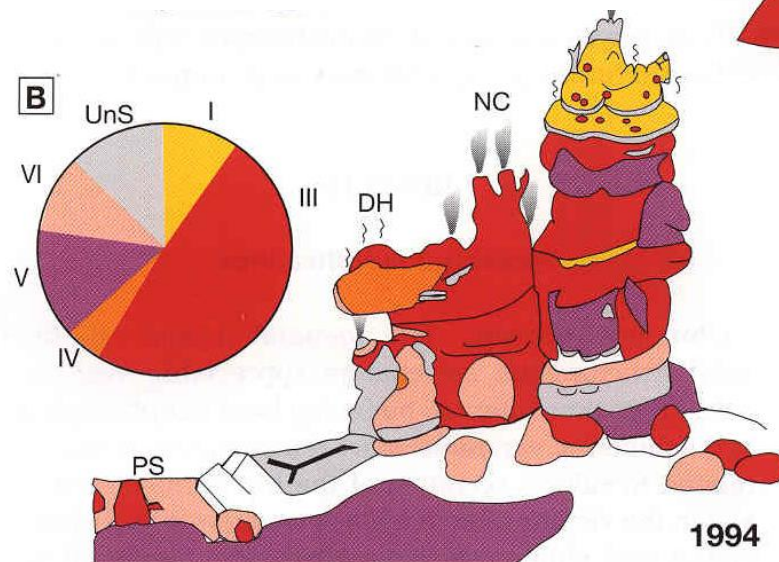

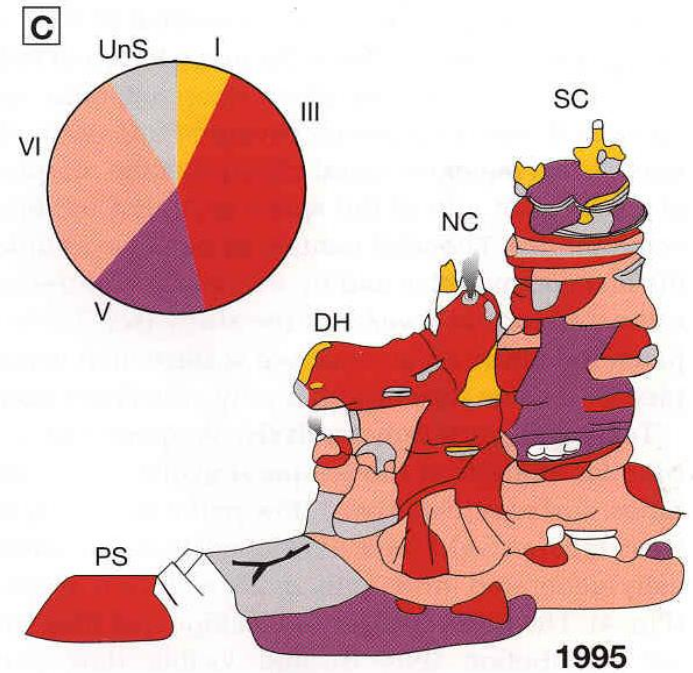

It depends

Spreading rate (as it relates to disturbance rate)

Mullineaux, Metaxas et al. in review

# Juan de Fuca – Endeavour

Sarrazin et al. 1997

# Mid Atlantic Ridge - Lucky Strike

# Juan de Fuca – Axial Volcano

Four studies on **recovery** – two on Juan de Fuca

In 3 years, over 60% of the volcano species pool had returned! (**BUT** = 50% of Endeavour pool)

Tunnicliffe et al. 1997, Marcus et al. 2009

# Larval dispersal - colonizing vents

How far larvae travel depends on

## ❖ How long they live

50% of deep-sea larvae: 35 days

75% of deep-sea larvae: ~ 70 days

## ❖ How fast the currents move

1 – 10 km per day

## ❖ Geological formations on the seafloor

They steer the currents

# Population connectivity

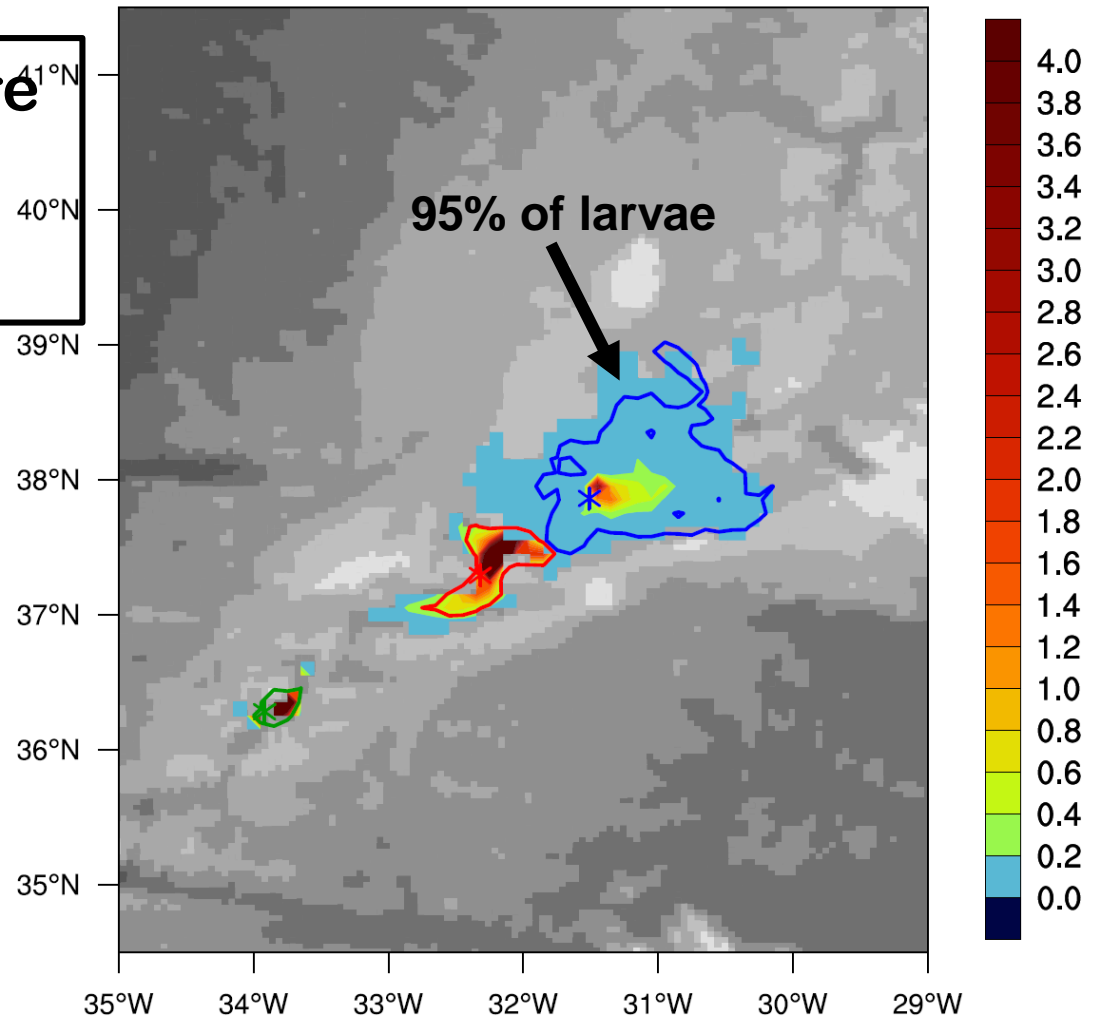

# Dispersal probabilities using a biophysical model *Bathymodiolus* spp. (travelling for 6 months)

Max distance to ensure connections

100 km

- \* Rainbow
- \* Lucky Strike
- \* Menez Gwen

# Larval settlement – everywhere is not the same

Kelly et al. (2007)

# Reference zones – Design considerations

## How large?

- Viable population that can self recruit
- Different potentially linked habitats within one zone (e.g. focused and diffuse flows)

*Baseline data:* distribution of habitat types, settlement preferences, ocean circulation, larval availability; **site specific**

# Reference zones – Design considerations

## How many?

- Adequate replication of all represented habitat types
- Multiple populations (including source populations)

*Baseline data: variability* in abundance, diversity, rates of settlement; used to calculate the number needed using standard statistical approaches; ocean circulation; *site specific*

# Reference zones – Design considerations

## How far apart?

Ensure larval dispersal between units

*Based on literature:* ≤ 100 km

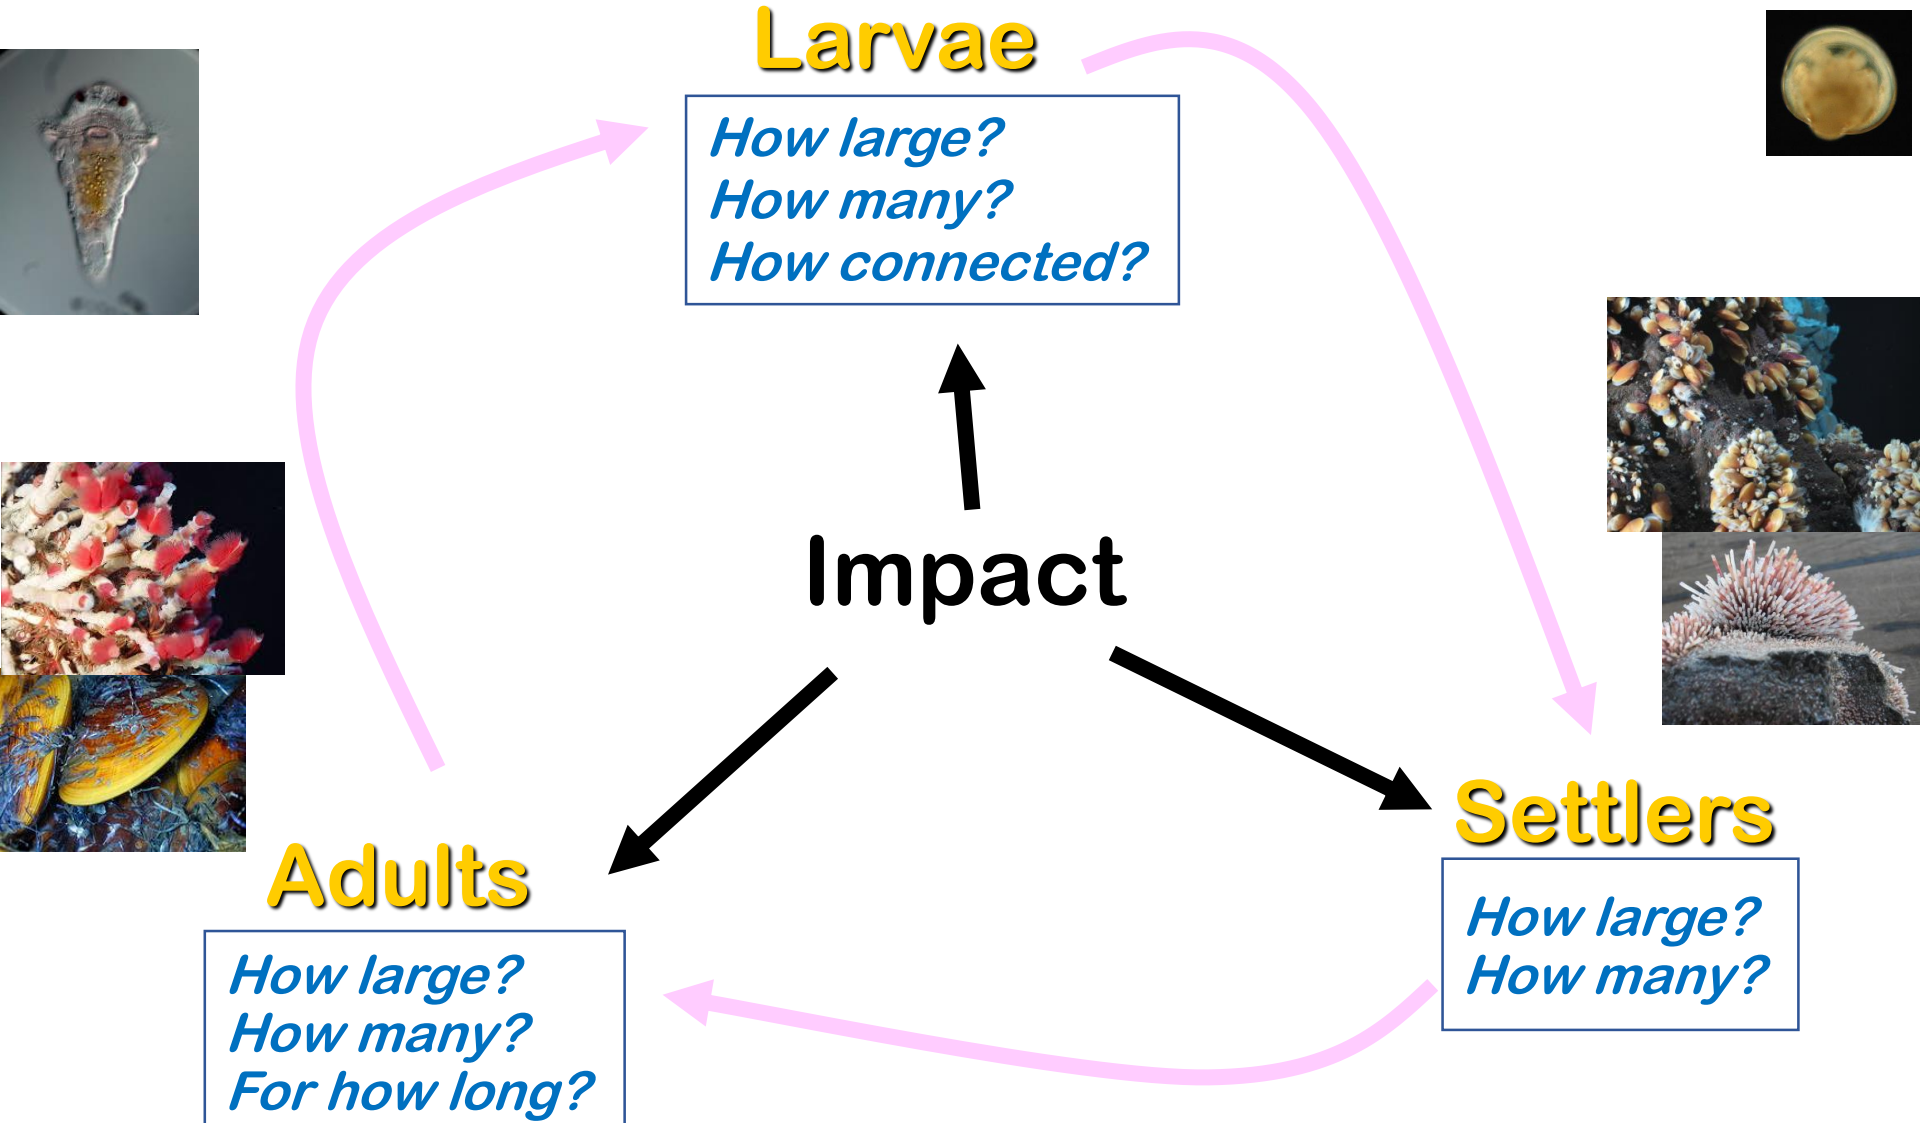

## How long? < 10 to > 100 years

*Baseline data:* rate of natural ecosystem change; **site specific**

Network of **well-connected** units (via dispersal)

# Reference Zones: Design considerations

Thank you!
